Minister's Message

Manitoba Agriculture is proud to partner with the Manitoba Seed Growers' Association and Seed World Group to produce *Seed Manitoba* 2026. This guide provides producers with independent, third-party data to support variety selection decisions for the upcoming crop year. With crop varieties tested at over 20 locations across Manitoba, *Seed Manitoba* offers

valuable insights into performance under local conditions, including agronomic details, disease resistance, and quality information for both new and existing varieties.

This guide is made possible through the dedicated and collaborative efforts of the Manitoba Crop Variety Evaluation Team (MCVET), crop research contractors, producers, the seed industry, commodity associations, Agriculture and Agri-Food Canada (AAFC), and staff from Manitoba Agriculture.

Agriculture remains a key industry in Manitoba, significantly contributing to Manitoba's economy. Crop producers play a crucial role in ensuring that agricultural products are among the province's largest exports. Each growing season presents its own challenges, and I would like to acknowledge the hard work of producers and express my gratitude for your unwavering dedication to the agriculture industry.

As you plan for the 2026 season, I wish everyone a successful growing season ahead.

Honourable Ron Kostyshyn
Minister of Agriculture

President's Message

The Manitoba Seed Growers' Association is proud to cooperate with numerous industry partners to present the 2026 edition of *Seed Manitoba*.

Seed Manitoba has been, and continues to be, one of the most widely used tools for variety selection by farmers in Manitoba. The success of this publication

results in part from the cooperative efforts of various industry representatives and specialists who make up the Manitoba Crop Variety Evaluation Team (MCVET).

You may notice a new feel and look for *Seed Manitoba* 2026 from previous editions. After several years of partnership with the *Manitoba Co-operator*, MCVET has changed publishers. Seed World Group has several years' experience in Canada's seed industry as well as other provincial seed guide publications, and we are excited about the new partnership.

I would be remiss if I didn't mention how grateful the Manitoba Seed Growers' Association is for the excellent partnership we had with the various iterations of the *Manitoba Co-operator* brand.

It started with a group of dedicated and talented individuals as the Manitoba Pool Elevator's publication the *Manitoba Co-operator*. *Seed Manitoba* followed

those same individuals when they launched the *Farmers' Independent Weekly*, and finally we remained a partner when they became Glacier Farm Media and *Seed Manitoba* was once again released bundled with your *Manitoba Co-operator* subscription.

As you review the variety trial results within this guide to decide which varieties are right for your operation, remember that your local seed grower can often provide added, regional insight on how new varieties compare, having grown them alongside the established varieties in the years of seed increase leading up to commercial release.

The board of the Manitoba Seed Growers' Association is proud to be part of this publication, and it is our wish that as farmers are making important decisions for the 2026 growing season, the resources in this guide will be a critical source of information.

A.J. Armstrong
President,
Manitoba Seed Growers' Association

WE'RE GOING TO BE YOUR #1 SEED

JUST WATCH US

We're developing the high yielding hybrids and varieties you need across canola, corn, and soybeans. Our DEKALB® seed lineup is stronger and more advanced than ever. We're not holding back. We're working to be your #1 seed.

Welcome to Seed Manitoba 2026

By Dennis Lange and Sonia Wilson, *Seed Manitoba* Editors

Welcome to *Seed Manitoba* 2026, the variety selection and growers' source guide for Manitoba producers, compliments of Manitoba Agriculture, Manitoba Seed Growers' Association, and Seed World Group. *Seed Manitoba* is a collaborative effort between industry, government, and producers to provide unbiased, local variety information from sites across Manitoba.

This year, the MCVET committee has decided to change publishers and adopt a refreshed, modern look for the publication, which we are excited to share.

Where Does the Data Come From?

Data is from replicated small plot trials grown in many locations throughout Manitoba and compiled over years. The main data collected is yield and protein, with other agronomic information in the "Variety Description" tables compiled from data submitted at the time the variety was registered. Some ratings in the "Variety Description" table, such as disease resistance, can change as pathogens change and reaction to disease races are better understood.

Our site contractors worked hard to have sites harvested in time for the data to be approved and published in *Seed Manitoba*. There was some yield and quality data that did not meet our publication deadlines; this data will be available in the Web Exclusive section of our website found at seedmb.ca.

Testing Locations and Site Years

Testing locations are chosen by the Manitoba Crop Variety Evaluation Team (MCVET) to represent the production area of each crop type. Crops with wide adaptation such as barley, fall rye, oat, spring and winter wheat, are planted at all sites. Crops like flax, field peas and lentils are only planted at locations where they are typically grown. Other crops like canola, corn, dry beans, soybeans, faba beans, and sunflowers are coordinated through their crop commodity associations and planted where they deem appropriate.

How Can *Seed Manitoba* Help with Variety Selection?

Seed Manitoba provides unbiased replicated data, giving producers, seed growers, and seed retailers more insight

into variety performance throughout the province. Yield data is displayed by location to show local performance as well as summarized across locations and years.

Changes to Note

There are a few changes in *Seed Manitoba* 2026 to note: silage corn trials and durum wheat trials were absent in the 2024 growing season but have returned to the seed guide this year. Hemp was not tested in 2023-2025 growing seasons but expected to return in the 2026 season.

Thank you to all of the contributors to *Seed Manitoba*. This publication would not be possible without the sponsors, supporters, site contractors, the Manitoba Crop Variety Evaluation Team (MCVET), and the commodity groups that donate data. The team behind *Seed Manitoba* hopes that you find the information beneficial as you make variety decisions in the coming months.

Any questions or concerns regarding *Seed Manitoba* can be directed to dennis.lange@gov.mb.ca or sonia.wilson@gov.mb.ca. ■

DEEPER THINKING, ADVANCING INNOVATION

From the lab to the field, everything we do at FMC is driven by our commitment to innovation. Through our ongoing R&D and advanced technologies, we are delivering sustainable, user-friendly solutions that help Canadian growers boost yields and maximize returns.

Above The Fields: Understanding Drone Regulations in Crop Protection

DRONES HAVE EMERGED AS A NEW AND EFFICIENT TOOL FOR APPLYING PESTICIDES. THEIR PRECISION AND ADAPTABILITY ARE CHANGING HOW PEST MANAGEMENT IS APPROACHED.

By Pratisara Bajracharya, Pesticides Regulatory & Minor Use Specialist

Effective pest management is a vital component of crop production. On the Prairies, ground spraying equipment and fixed-wing piloted aircraft have traditionally been used to apply pesticides in fields. The fixed-wing piloted aircrafts have also been used for pesticide application in non-crop areas such as mosquito larvicide, industrial sites and forestry applications. In recent years, drone application of pesticides has become increasingly popular.

Drones are remotely piloted aircrafts which were first introduced in agriculture as an agronomic tool. Several names have been used worldwide to refer to drones. Some of the common names used to address drones are Unmanned Aerial Vehicle (UAV), Unmanned Aerial System (UAS), Remotely Piloted Aircraft (RPA), Small Unmanned Aerial System (SUAS), Remotely Operated Aircraft (ROA), Remotely Piloted Aerial Application System (RPAAS), etc.

In Canada, Remotely Piloted Aircraft Systems (RPAS) is the term used to refer to drones. Over time, drones have advanced in scale, capability, and function, making them a versatile tool across various sectors.

Many Asian countries such as China, Japan and South Korea have successfully utilized drones for pesticide application for several years. Drone use in pesticide application in the United States is still relatively new. In Canada, drones were recently introduced as a potential new method of pesticide application and have been gaining popularity.

The growing interest in use of drones for pesticide application has sparked important discussions around the regulatory requirements governing their operation in agriculture and other areas.

In Canada, all pesticides sold or used must be registered with Health Canada's Pest Management Regulatory Agency (PMRA) under the federal Pest Control Products Act (PCPA). The PMRA conducts a rigorous, science-based evaluation of each pesticide, including application methods, to ensure it poses no unacceptable risk to human health or the environment.

Once a pesticide is registered in Canada, it is issued a label that serves as a legal document. This label outlines important information, including the approved application methods, rates of use, wind speed and temperature requirements, and other safety guidelines. Under the Pest Control Products Act (PCPA), deviation from the instructions specified on the label is considered a violation. Therefore, only the application methods explicitly listed on the pesticide label are legally permitted.

As of Oct. 13, 2025, there are a total of five pesticide products for which drone application have been approved. All of those pesticides are approved for drone application in non-crop areas such as mosquito larvicide, right-of-way and industrial site applications. To date, in-crop drone application of pesticides has not been approved for any pesticide product.

All pesticides approved for application by drones must have RPAs mentioned on the pesticide label before they can be deployed in pesticide application. If a pesticide product does not have the RPA method of application mentioned on the label, then a drone cannot be used to apply that pesticide product.

The recent addition of drone application to a limited number of pesticide labels has sparked debate among pesticide users, particularly around whether drones

In recent years, drone application of pesticides has become increasingly popular.

are fully approved for in-crop use. Some stakeholders have called for a blanket approval that would allow all pesticides to be applied using drones. However, pesticide products and their labels are owned by individual companies, known as registrants.

Any change to a product's approved use, including the addition of drone application, requires the registrant to submit a formal application, supported by scientific data, to the PMRA. The PMRA must then assess whether this new method of application, via drones, continues to meet the agency's rigorous health and environmental safety standards. As a result, a blanket approval for drone use across all pesticides may not currently be feasible.

In addition to federal regulations, commercial pesticide applicators intending to use drones are also subject to provincial legislation. In Manitoba, all commercial applicators (including those intending to apply pesticides by drone) require an aerial drone licence from Manitoba Agriculture. To get the license, you must hold a drone pilot certification from Transport Canada as a pre-requisite. The drone pilot certification allows individuals to take the required pesticide certification courses (Pesticide Core and Aerial Drone).

Once an applicant successfully completes all applicable pesticide certification exams, they may apply for a pesticide applicator's licence for the aerial drone class. The aerial drone class license will allow pilots to commercially apply approved pesticides by drones. All commercial applicators operating in Manitoba must carry valid liability and chemical injury insurance. If the insurance policy expires before the licence's expiration date, the applicator's licence becomes automatically invalid.

In conclusion, while drone technology holds significant potential to revolutionize pesticide application in Canada, its adoption by pesticide applicators depends on multiple factors, including federal and provincial legislation as well as economic feasibility. The current federal regulatory framework mandates that each pesticide intended for drone application undergo individual assessment and approval by Health Canada's PMRA. Until in-crop drone application approvals are granted, applicators must strictly adhere to existing federal and provincial regulations to ensure compliance and uphold the integrity of pest management practices. ■

Variety Development: Why Public and Private Plant Breeding Matter

A STRONG SEED INDUSTRY — AND RELIABLE VARIETY DATA — DEPEND ON KEEPING PUBLIC AND PRIVATE BREEDING HEALTHY, BALANCED AND ROBUST.

By Jennifer Seward, Executive Director, Manitoba Seed Growers' Association

Every winter, *Seed Manitoba* gives you clear comparisons to choose the right variety for your farm. Supporting those tables is a pipeline of genetics and a network of Prairie trial sites that rely heavily on Canada's public breeding system. That system is now at risk. If it weakens, your seed choices narrow and the data you trust becomes reduced.

That's a bold statement, but let's take a step back, and look at the two systems that deliver new genetics.

Public Research

Public research in Canada is conducted by Agriculture and Agri-Food Canada (AAFC) and universities. It focuses on the broader good rather than profit.

- It targets issues that may not be profitable but are critical — such as soil health, environmental conservation, crop types with high usage of farm saved seed with significant economic impact (such as wheat), and food security.
- It develops affordable genetics accessible to all, not just large agribusinesses.
- Universities and public institutions educate the next generation of scientists, agronomists, and producers.
- It often emphasizes climate adaptation, biodiversity, and pest management that protect ecosystems.

Private Research

Private research is carried out by private companies often with a focus on developing marketable

Neither public nor private research can solve agricultural challenges on their own.

innovations that will show profits to their customers, their company and/or shareholders.

- Private investment fuels rapid development of new products.
- Many breakthroughs that deliver modernization and new genetics quickly come from private R&D programs. This is typically specific by crop type.
- Private companies can quickly adapt innovations to changing market and agronomic needs.
- Competing firms push one another to create better products and services for farmers.

Neither public nor private research can solve Canadian agricultural challenges on their own. Our strongest outcomes and successes for Canadian farmers only happen when the two mandates are strong, viable, and can build on each other.

A balanced system ensures that innovations serve both economic and public interests.

What is the Future of AAFC Breeding Programs?

For years now, AAFC has signaled to the Canadian agricultural industry that they wish to step back from finishing varieties. This means that varieties won't be released to the marketplace by AAFC; only traits will be developed for the use of private industry to purchase and develop for producers.

This move would be devastating to farmers. Not only could we lose the AAFC breeder brain trust that has advanced and supported Canadian farmers for generations, but we could also lose the advancements still in the pipeline that they have worked so hard to develop for us — with producer and taxpayer dollars.

Why Seed Manitoba's Tables Depend on Public Infrastructure

Independent, multi-year, multi-location testing is the backbone of Canada's Variety Registration System and underpins the majority of the information you see in *Seed Manitoba*. Those comparisons require sites, technicians, and standardized methods across regions and seasons. AAFC and university partners host and support co-op trials (merit testing required for variety registration, including disease ratings) and MCVET sites, as well as the people that make unbiased testing possible. They also supply a steady stream of candidate lines that keep variety lists competitive and relevant.

If public stations close, roles are left unfilled, or breeding programs are consolidated away from local selection, two things follow quickly: fewer entries in the trials and fewer Manitoba-specific datapoints to validate claims. *Seed Manitoba* cannot report what is not tested.

What Risk Looks Like on a Farm Balance Sheet

When the public public institution assets diminish, check varieties get older without clear successors. Disease ratings stall. Agronomic traits drift from local needs. Trial tables get shorter and less representative. Farmers end up spending more on rescue agronomy, facing more dockage or rejections, and carrying more yield volatility from year to year.

What you can do this winter:

1. Start your shortlist with three-year regional results. Favour varieties with strong performance across multiple sites in Manitoba.

2. Ask about origin. When you weigh options, ask which programs developed the variety and where selections were made. Remember where your royalty dollars go when you make the decision to purchase pedigree seed.

3. Support a balanced and thriving research industry. Tell

commissions, grower groups, and elected representatives that a robust public/private breeding capacity is essential infrastructure.

4. Keep learning on your own ground. Run side-by-sides each year and share results. Farmer demand for Manitoba-ready genetics helps sustain the pipelines that supply them.

Bottom Line

Seed Manitoba's reliable comparisons and many of the varieties you trust exist because public and private breeding programs compete for your acres. That foundation is not guaranteed. If we want strong information and strong choices five and 10 seasons from now, we need to keep public variety development vibrant and healthy. ■

Beyond the Season: Soil Fertility Management for Long-Term Success

MANAGING FERTILIZER DECISIONS STRATEGICALLY IS MORE IMPORTANT THAN EVER TO PROTECT PROFITABILITY UNDER CURRENT MARKET CONDITIONS.

By Marla Riekman, Soil Fertility Specialist, Manitoba Agriculture
Darren Bond, Farm Management Specialist, Manitoba Agriculture

In the current agricultural landscape, producers face increasing pressure to make fertilizer decisions that balance short-term economic realities with the need for long-term soil fertility and sustainability.

Rising input costs, volatile commodity prices, and tighter margins shift the focus to immediate returns. However, overlooking the broader agronomic context can compromise future productivity and profitability. So, what is the best approach when faced with immediate economic uncertainty?

The Cost of Fertilizer: Growing Concern or Persistent Problem?

Fertilizer seems to have been expensive for several years now. When crop prices were high and margins were good, the impacts of high fertilizer prices were tempered. However, with softer grain prices and tighter margins, the impacts of high fertilizer prices are more pronounced, emphasizing the importance of successfully managing fertilizer decisions.

Traditional strategies, like obtaining several quotes from multiple input retailers and buying in the off-season to store, usually provide positive results. Still, nitrogen (N) costs are approximately 20% higher compared to last year. There is also a significant difference in the price between the different N sources that can be used to increase profitability on the farm.

For example, in the fall of 2025, anhydrous ammonia was 20% cheaper than urea. Producers that have the ability to use different N sources on their farm have a competitive advantage in markets where there are considerable price differences between sources.

While phosphorus (P) fertilizer hasn't seen the same level of price increases as N, it is also still expensive. Knowledge plays a critical role here. Understanding the price differences and fertilizer properties between the different formulations on the market today will reveal the true cost of P. Also knowing your P soil test levels will reveal the appropriate fertility plan to achieve success in the growing season.

Don't Guess, Soil Test

Regular soil testing provides an inventory of nutrient levels in the field. When combined with fertilizer

Regular soil testing also helps to track long-term trends. Are P levels declining, holding steady, or increasing?

recommendations that are tailored to regional soil and climate conditions, economic returns from fertilizer application can be maximized. Recommended fertilizer rates may be adjusted based on timing and application method. The principles of 4R Nutrient Stewardship (Right Source at the Right Rate, Rate Time and Right Place) allow for flexibility in fertilizer management to maximize crop yields, while minimizing environmental impact; however, choosing the right rate is highly dependant on understanding the existing nutrient levels in the field.

Residual nitrate levels tend to be low following solid-seeded cereal and oilseed crops, but may be higher following heavily fertilized row crops, such as corn. Fields with a history of N application greater than crop requirements, or that have been affected by drought or another factor that severely limited crop yields, often have high residual nitrate levels. If this available N is not accounted for when fertilizer recommendations are developed for the following year, not only is there

a greater potential for environmental losses, but the extra fertilizer applied becomes a wasted input, limiting economic gains.

Balanced Inputs, Better Outcomes

Regular soil testing also helps to track long-term trends. Are P levels declining, holding steady, or increasing? As a general rule, soil test phosphorus (STP) will increase one part per million (ppm) for every 20-30 pounds of P applied over and above what the crop removes. This could mean a single-year P application of 60 pounds per acre (-115 pounds of MAP per acre) may only raise soil test levels by ~1 ppm. Building P levels may not be feasible during times of high fertilizer prices or tight margins, but maintaining a good soil P supply can pay off in the long term.

Crop response to P fertilizer is a game of probabilities. If STP is below 10-12 ppm, the probability of a yield response is high. When STP is above 18-20 ppm, the probability of a yield response is low. The “sweet spot” is generally in the 12-18 ppm range, where it is recommended to apply P at crop removal rates to maintain that same STP level going forward.

If STP is below 10-12 ppm, then it may be beneficial to build STP levels by applying P at a rate greater than crop removal. When STP is high, it's still recommended to apply P at starter rates to ensure the crop has access to

adequate P early in the growing season, especially if the soil is cold and dry at seeding time.

Understanding STP trends through regular soil testing allows one to balance P fertilizer based on long term crop rotations, rather than responding to annual requirements. If STP is low, it is important to invest in P during times of low fertilizer and/or high commodity prices. If STP has been built up to a medium to high level, then it is possible to be more reactionary to high fertilizer prices in the short term without the same long-term consequences. A few years of starter P rates may slowly deplete STP; however, if one has concentrated on building STP when fertilizer is affordable, then a short-term reduction in P rates won't devastate those STP reserves.

To determine crop removal rates for balancing P in the rotation, visit prairienutrientcalculator.info.

Fertility Planning with a Long-Term Lens

Given the continued volatility in fertilizer prices and the pressure of tight profit margins, producers must make economic decisions that maintain yield potential without compromising soil fertility. Regular soil testing provides critical insights into nutrient availability, guiding precise application rates and preventing both over- and under-application. Strategic nutrient planning, grounded in agronomic data and economic analysis, is essential for sustaining profitability into the future. ■

¹ Weather data is reported from May 1 to October 1 and reflects the percentage of the normal accumulations as calculated using the 30 year long-term average.

² Weather datasets are incomplete. Carberry is missing 12 days, Morden is missing 20 days, Winnipeg is missing 4 days.

Seeding and harvest dates for individual trials can be found at the bottom of the Yield Comparisons Tables located in the respective Crop Sections.

As per MCVET, MCC, NSAC and MPSG protocol's, all sites are fertilized at levels to achieve maximum crop performance. Weed control is applied as required to achieve a relatively weed free area. Insecticides are applied as required, while fungicides are not applied to any trials.

Any questions related to the sites found in Seed Manitoba can be directed to the individuals listed below:

For canola contact Jared Bento at (204) 891-1273 or e-mail jared@canolagrowers.com

For grain corn, silage corn, and sunflowers, contact Surjit Bawa at (204) 918-3079 or e-mail surjit@mbcropalliance.ca

For soybean and dry beans, contact Dennis Lange at (204) 324-4383 or e-mail dennis.lange@gov.mb.ca

For all remaining crop types, contact Uzzal Liton at (204) 441-0570 or e-mail uzzal.liton@gov.mb.ca

The data in this listing includes pedigreed seed crops that have successfully received, or are in the process of receiving, seed crop certification from the Canadian Seed Growers' Association (CSGA). Fields that were declined pedigreed status are not included in this listing. Data is provided for information purposes only. All users of the CSGA data use such data at their own risk. You and those who rely on the CSGA data cannot hold CSGA liable for omitted or incorrect seed listings. You agree to save CSGA harmless and fully indemnify CSGA from all losses, damages, liability, judgements, costs and expenses, which you or a user of the CSGA data sustain by disseminating or relying on such data. When purchasing seed, CSGA strongly recommends asking for official seed certification tags as your proof of CSGA certification. A copy of the mechanical purity and germination analysis test certificate should also be made available to you.

Cereal Crops

Variety Description Key

The grey box at the bottom of each table displays the Grand Mean for both Yield (bu/acre) and Protein (%) and the corresponding LSD (Least Significant difference) value ($p < 0.05$). Varieties must differ by the LSD value ($p < 0.05$) to be considered significantly different from one another.

Except for the long-term average yield and protein data, variety description information was obtained from the variety registration trials. For Relative Maturity, please keep in mind the actual number of days to reach maturity will depend on local climactic conditions and to some extent on management practices.

Long term-yield data is from MCVET plots harvested from 2011 to 2025, while protein is from 2007 to 2025. Actual protein will depend on seasonal growing conditions and fertility levels.

“Resistance Level” Disease ratings: R = Resistant; MR = Moderately Resistant; I = Intermediate; MS = Moderately Susceptible; S = Susceptible; “ - ” = not available; NT = Not Tested.

“Resistance Level” Lodging and Sprouting ratings: VG = Very Good; G = Good; F = Fair; P = Poor; VP = Very Poor; “ - ” = not available.

Site Years Tested is the cumulative number of locations over the years that a variety has been tested. The more site years the more dependable the data.

☞ Indicates a variety that is protected by Plant Breeders' Rights legislation that complies with UPOV 1978.

Ⓢ Indicates a variety that is protected by, or has been applied for and is pending, Plant Breeders' Rights legislation that complies with UPOV 1991.

VUA Variety Use Agreement in effect.

Key to 2025 Yield and Protein Tables

Yields derived over 2 or more growing seasons are the best indicator of variety performance. Use single site year data with caution.

CV % = Coefficient of Variation. A measure of random variation in a trial. A low CV is desirable.

LSD (bu/acre) = Least Significant Difference. Varieties must differ by the LSD value ($p < 0.05$) to be considered significantly different from one another.

Sign Diff = Significant Difference. Indicates if a real difference exists between varieties at an individual site.

Intellectual Property and Patent Protection

Certain crop varieties described in this guide may be protected by Plant Breeders' Rights (PBR) or a Variety Use Agreement (VUA). The inclusion of any protected variety in this publication does not grant, convey, or imply any license or right to reproduce, propagate, sell, or otherwise use the protected material in any way that would infringe upon such rights. Users are responsible for ensuring compliance with all applicable intellectual property laws and regulations before acquiring, reproducing, or distributing plant material.

Unauthorized propagation, sale, or export of protected varieties may constitute a violation of patent or PBR laws and may result in civil or criminal penalties.

Data Accuracy and Limitations

The performance data, descriptions, and other information contained in this guide are based on research trials and other sources believed to be reliable at the time of publication. However, results may vary depending on local conditions, management practices, and environmental factors.

All information is provided “as is,” without warranty of any kind, express or implied, including but not limited to warranties of accuracy, completeness, fitness for a particular purpose, or non-infringement.

The publishers, authors, and contributors accept no liability for any loss, damage, or injury resulting from the use of the information or materials contained herein.

Trademarks

All trademarks, trade names, and brand names mentioned in this guide are the property of their respective owners. Their inclusion does not imply endorsement or affiliation.

Thank you to MCVET Sponsors and Supporters in 2025

MCVET gratefully recognizes the support and financial contribution of the following organizations:

Agriculture and Agri-Food Canada
Alliance Seed
Canada-Manitoba Crop Diversification Centre
CANTERRA SEEDS
FP Genetics
Manitoba Agriculture
Manitoba Beef Producers
Manitoba Crop Alliance
Manitoba Pulse & Soybean Growers
Manitoba Seed Growers' Association
Nutrien Ag Solutions

Parkland Crop Diversification Foundation
Prairies East Sustainable Agriculture Initiative
Richardson International - Kelburn Farm
SeCan
Seed Depot
SeedNet
Seed World Group
University of Manitoba
UPL AgroSolutions Canada
Westman Agricultural Diversification Organization

MCVET would also like to express its gratitude to:

South Interlake Crop Testing Committee (SICTC) and Crop Research Organization Portage (CROP) for locally organized variety trials.
University of Saskatchewan for seed preparation and randomization of flax trials.

Manitoba Agriculture Variety Guide

BARLEY

New for 2026

Variety	Type	Code	Breeder	Distributor	Seed Availability
CDC Harness (2) ☉	Food and Feed	FB21106	Crop Development Centre	FP Genetics	2028
CDC Pristine (2) ☉	Hulless	HB21355	Crop Development Centre	SeCan	2027
CDC Armstrong (2) ☉	Hulless	HB20351	Crop Development Centre	SeCan	2027
WCI Fortify (6) ☉	Food and Feed	FB22816	Field Crop Development Centre	SeedNet	2026

Malting barley varieties are classified into two groups. The "Malting: Acceptance - Recommended" group are varieties with recommended market acceptance as listed in the Canadian Malt Barley Technical Centre (CMBTC) publication "2026/27 Recommended Malting Barley Varieties" on page 22. The category of "Malting: Other" includes varieties not currently recommended by the CMBTC but markets may exist.

SY Stanza ☉ is a non-GN (glycosidic nitrile) two-row malting variety.

The two-row malting variety CDC PlatinumStar ☉ is available through a closed loop identity preserved program.

It is strongly recommended for producers to use a combination of the Canadian Food Inspection Agency's List of Registered Varieties (inspection.gc.ca) and the Canadian Grain Commission's Variety Designation Lists (grainscanada.gc.ca) to determine the registration and grade eligibility status of varieties.

A number of new varieties are participating in a Variety Use Agreement **VUA**. If producers purchase a VUA variety and divert some of that grain at harvest for seed use, they will be invoiced a Variety Use Fee for use of the seed. Ask your retailer about your obligations to the VUA when purchasing seed.

¹ Values in brackets indicate row and type: 2 = two-row; 6 = six-row; W = white aleurone (all others yellow); F = fodder.

² R = Rough, S = Smooth, SS = Semi-Smooth

³ Reactions given for old races of stem rust. All cultivars are susceptible to new race QQCI. However, to date this has not caused widespread damage. Early seeding will generally reduce the likelihood of severe infection.

⁴ Fusarium head blight (FHB) infection is highly influenced by environment and heading date. Under high levels of the disease, all varieties will sustain damage.

NT = Not tested for disease, until a full rating is generated assume that the variety is susceptible to the disease.

PERFORMANCE YOU CAN COUNT ON. **GROWN WITH PRIDE.**

From planting to harvest, farmers have trusted **PRIDE Seeds** for generations.

Our corn genetics deliver **reliable yields** across diverse environments, **strong standability** for smoother harvests, and **top-quality forage** to meet the feed demands of Canadian dairy and beef operations. Backed by agronomic support, our hybrids help you maximize every acre with confidence. Together, we harvest more than a crop—we harvest a legacy.

OUR LATEST TOP CHOICES FOR WESTERN GROWERS:

- ✓ **Grain** → **A5175G2 RIB**: Strong late-season health, excellent emergence, and early vigour for quick establishment, with solid stress tolerance and silage versatility.
- ✓ **Silage** → **AS1058G2 EDF RIB**: High forage yield and energy density with integrated insect protection for season-long plant health and maximum feed value.

SECURE YOUR SEED AND START YOUR SEASON STRONG.

Scan the QR code to get started. Your local PRIDE Seeds dealer can help you find the right hybrid for your fields.

Stay connected all season long—follow us for harvest highlights and next year's insights.

**FOCUSED ON
PERFORMANCE**

2026-2027

MALTING BARLEY RECOMMENDED VARIETIES

The Recommended list is developed in consultation with Canadian Malting Barley Technical Centre (CMBTC) members. This list highlights varieties tested at the CMBTC that show strong malting characteristics and market potential.

2026-2027 RECOMMENDED VARIETIES

VARIETY	EXPORT DEMAND	DOMESTIC DEMAND	DISTRIBUTOR
AAC CONNECT	Growing	Growing	CANTERRA SEEDS
CDC FRASER	Growing	Growing	SeCan
CDC CHURCHILL	Growing	Growing	SeCan
AAC SYNERGY	Peaked	Peaked	FP Genetics
CDC COPELAND	Declining	Declining	SeCan

Please consult with your grain or malting company representatives about marketing and contracting opportunities when choosing a variety.

2025 SEEDED AREA BY MAJOR MALTING VARIETY PERCENTAGE (%) - WESTERN CANADA

Distribution of malting barley varieties as a percentage (%) of area seeded with malting barley in western Canada in 2025. Source: CGC (based on data from provincial crop insurance agencies).

VARIETIES IN DEVELOPMENT

These newly registered varieties are being tested and promoted for commercial market acceptance. If you're interested in trying them, contact your seed distributor to learn about trial opportunities.

VARIETY	DISTRIBUTOR	FEATURES	MARKET
AAC PRAIRIE	CANTERRA SEEDS	Short, strong straw; medium protein; high enzyme	Adjunct brewing, distilling
AB FOOTHILLS	CANTERRA SEEDS	High yield; lower protein; high enzyme	Adjunct brewing, distilling
SY STANZA	FP Genetics	Short, strong straw, medium protein, low enzyme, non-GN ¹	Adjunct and craft brewing, distilling

There are also contracting opportunities for:

CDC Goldstar (CANTERRA SEEDS)	Legacy (FP Genetics)	Bill Coors 100 (Stamp Seeds)
---	--------------------------------	--

To discuss contracting opportunities for these varieties, please contact the following companies: Prairie Malt (Boortmalt) - CDC Goldstar; Bunge - Legacy; Molson Coors - Bill Coors 100.

¹Non glycosidic-nitrile barley varieties are suitable for all-malt distilling.

AAC Fetch ☺	OT2148	AAFC - Brandon	Alliance Seed	2028
AAC Gladys ☺	OT2152	AAFC - Brandon	FP Genetics	2028
CDC Hank ☺	OT3121	Crop Development Centre	FP Genetics	2027

Comments:

There have been changes within the oat crown rust pathogen populations that has seen virulence developed on a number of oat varieties. Resistance to oat crown rust is likely poorer than shown in the table below with most varieties expected to be moderately susceptible or worse under severe epidemic conditions.

Producers are encouraged to check the “Preferred” or “Approved” lists available at most mills if they are selecting varieties for the milling market. These lists are updated as new genetics become available.

CDC Morrison ☺ is exceptionally high in beta-glucan fibre and is available for contract identity preserved production.

GRAND MEAN (bu/acre)		152										
LSD (bu/acre) (0.05)		8										

¹ The letter 'F' indicates a forage type.² All varieties are susceptible to new stem rust races NA67 and NA76 and these races caused moderate damage to crops in the Red River Valley in 2001 and 2002. Early seeding will generally reduce the likelihood of severe infection.³ BYD = Barley Yellow Dwarf - a viral disease carried and spread by aphids. Early seeding will generally reduce the likelihood of severe infection.

NT = Not tested for disease, until a full rating is generated assume that the variety is susceptible to the disease.

Comments:

Midge tolerant varieties are designated by the letters 'VB', which stands for Varietal Blend. The varieties contain the Sml gene for tolerance. To manage against the build-up of midge resistance to the gene, an interspersed refuge is used commercially. More information on midge tolerant wheat varieties and interspersed refuge can be found at midgetolerantwheat.ca.

The varieties CDC Hughes VB ☺ and CDC Landmark VB ☺ have partial solid stems, which can provide protection against the wheat stem sawfly.

Most varieties have been rated for their relative resistance to pre-harvest sprouting. Under wet post-maturity conditions varieties rated poor (P) would have reduced ability to retain Hagberg Falling Number values relative to those rated good (G) or very good (VG).

Producers are strongly encouraged to use the Canadian Grain Commission's Variety Designation Lists (grainscanada.gc.ca) that indicate the varieties belonging to each class of wheat in Canada.

It is also recommended for producers to use the Canadian Food Inspection Agency's List of Registered Varieties (inspection.gc.ca) to determine registration status of varieties.

A number of new varieties are participating in a Variety Use Agreement **VUA**. If producers purchase a VUA variety and divert some of that grain at harvest for seed use, they will be invoiced a Variety Use Fee for use of the seed. Ask your retailer about your obligations to the VUA when purchasing seed.

¹ Leaf Spots rating is a combination of resistance to tan spot, spot blotch and septoria leaf disease complex.² Fusarium head blight (FHB) infection is highly influenced by genetics, environment and heading date. Under high levels of disease pressure, all varieties will experience yield and/or quality loss.

DURUM WHEAT

New for 2026

Variety	Code	Breeder	Distributor	Seed Availability
AAC Frontier	DT2033	AAFC Swift Current	SeCan	2027
AAC Schrader	DT2009	AAFC Swift Current	FP Genetics	2024
CDC Evident	DT1020	Crop Development Centre	Alliance Seed	2026
CDC Wiseton	DT1024	Crop Development Centre	SeCan	2026

Comments:

The varieties AAC Grainland, AAC Weyburn VB, AAC Raymore, AAC Stronghold, and AAC Cabri have solid stems with resistance to the wheat stem sawfly. Midge tolerant varieties are designated by the letters 'VB', which stands for Varietal Blend. The varieties contain the Sml gene for tolerance. To manage against the build-up of midge resistance to the gene, an interspersed refuge is used commercially. More information on midge tolerant wheat varieties and interspersed refuge can be found atmidgetolerantwheat.ca

Win the Start.

With Canada's most complete canola seed protection.

Your best start begins with Lumiderm™ insecticide seed treatment. Lumiderm provides the most complete seedling protection, giving your crop the best start possible.

- ✓ Premium control of early season cutworms
- ✓ Proven crucifer & striped flea beetle protection
- ✓ Excellent early season seedling stand establishment
- ✓ Increased plant vigour and biomass

Book today and Win the Start with Lumiderm.

WINTER WHEAT

Comments:

Broadview and CDC Falcon are hard red kernel types.

AAC Elevate  has resistance to wheat curl mite, the vector that transmits wheat streak mosaic virus. To preserve the effectiveness of the tolerance gene, agronomic practices eliminating the 'green bridge' of plant material that serves as a reservoir for mites should be followed whenever possible.

¹ Maturity ratings: E = Early, M = Medium and L = Late. Varieties plus 2 to 4 days compared to CDC Falcon would be Medium (M) maturing. Varieties greater than 4 days compared to CDC Falcon would be rated as Late (L) maturing.

² All registered varieties have adequate winter hardiness if seeded at the optimum date into standing stubble where good snow cover can be assured.

³ FHB infection is highly influenced by genetics, environment and heading date. Under high levels of disease pressure, all varieties will experience yield and/or quality loss.

FALL RYE

New for 2026

Variety	Class	Code	Breeder	Distributor	Seed Availability
SU Bebop  VUA	OP	RT281	Hybro Saatzucht GmbH & Co. KG	FP Genetics Inc.	2025

Comments:

Hybrid fall rye varieties have improved falling number. Typically, a falling number of 180 seconds or greater is preferred by the rye milling market. Falling number can be heavily influenced by moisture around harvest time.

Fall Rye Variety Descriptions

Variety	Site Years Tested	Yield (bu/acre)	Height ‘+/- 104 cm	Relative ¹ Maturity	Falling Number (Seconds)	Resistance Level:		Relative Winter Hardiness

SEEDING
THE FUTURE
SINCE 1856

Two Canadian Brands. One Standard

Seed That Works as Hard as You Do

NEW

CS Baker

Canada Western Red Spring

High-yielding, short-stature wheat with excellent milling quality and upcoming inclusion in the Warburtons program.

YIELD 112% vs: AAC Brandon

2025 LCRC COMC Trial, avg. MB locs

NEW

CS Breadwinner

Canada Western Red Spring

Broadly adapted, high-yield spring wheat with good disease resistance and protein improvements.

YIELD 114% vs: AAC Brandon

2025 LCRC COMC Trial, avg. MB locs

CDC Envy

Canada Western Red Spring

CDC Envy is an exciting new CWRS that is early maturing, high yielding semi-dwarf with good standability.

MATURITY 3 DAYS EARLIER vs: AAC Brandon

Data compiled from 2024 MCVET program

AAC LeRoy VB

Canada Western Red Spring

AAC LeRoy VB CWRS has the amazing combination of high yields, disease resistance and midge tolerance, as well as consistent harvest quality that makes AAC LeRoy VB a go-to variety for farmers across Western Canada.

YIELD 103% vs: AAC Brandon

Data compiled from 2024 MCVET program

Connect with your local Seed Grower or call us at 877-270-2890 to speak to a Territory Manager.

NEW

CS4100 LL

LibertyLink® Canola

Featuring 7+ PodProtect™ shatter rating and high yield potential. Excellent disease resistance with multigenic blackleg and 1st and 2nd generation clubroot resistance.

YIELD 106% vs: InVigor L340PC
N=23, 2025 Strip Trials

Canola shatter ratings, Canola Council of Canada. Shatter ratings are subject to change. Performance may vary depending on environmental conditions and farming practices. LibertyLink® and the Water Droplet Design are registered trademarks of BASF. Used under license.

for Seed Excellence.

CANTERRA SEEDS and Alliance Seed are growing together.

Rooted in the Prairies, our two Canadian seed brands share a common goal — to deliver pedigreed seed and canola hybrids that perform for Western Canadian farmers. Together, we bring you one of the broadest field seed portfolios in the region, backed by proven results and support from people who understand your farm.

This is Canadian Certified Seed | ChooseCertifiedSeed.ca  It's your responsibility to know <https://seeds-canada.ca/en/seed-resources/plant-breeders-rights>

CS Camden

White Milling Oat

Grower and miller approved with exceptional yields and improved quality.

YIELD 106% **vs:** Summit

Data compiled from 2024 MCVET program

AAC Connect

2-Row Malting Barley

A top-performing variety with growing demand on the Recommended Malting Barley Varieties List by the Canadian Malting Barley Technical Centre (CMBTC).

YIELD 107% **vs:** CDC Copeland

Data compiled from 2024 MCVET program

CDC Endure

White Milling Oat

CDC Endure sets the benchmark for yield and quality in oats across Western Canada and is the variety that growers will choose for many years.

YIELD 109% **vs:** Summit

Data compiled from 2024 MCVET program

AAC Carver

Yellow Pea

Farmer's all-time favourite pea for its large seed size, high yields and early maturity.

YIELD 110% **vs:** CDC Meadow

A New Role — Offering Farmer Support with a Genetic Advantage

OPEN LISTENING, TRANSPARENCY AND COLLABORATION DEFINE EVERETT'S WORK WITH GROWERS, INDEPENDENT AGRONOMISTS AND THE RETAIL NETWORK.

By Chad Yanchyki, Sales Manager, FP Genetics

For decades, FP Genetics has played a quiet but vital role in Canadian agriculture — delivering seed genetics that farmers rely on to build their success. Now, with the introduction of the Western Product Specialist role, the company is strengthening that bridge between research, retail, and the realities of seed selection. Introducing Everett Boots, who's at the heart of this effort.

Growing up spending summers on his grandfather's farm east of Saskatoon, Sask., Everett developed an early love for agriculture. Enjoying being outside, working with crops and cattle, this connection guided him through a degree in agriculture at the University of Saskatchewan and over a decade with the Crop Development Centre, where he experienced firsthand the journey seed makes from breeding to field.

At the Crop Development Centre, he really came to understand the whole development process — from the initial variety breeding in the greenhouse to field trials and nurseries to the farmer's bin, and now, at FP Genetics, he aligns those dots in the real world.

Everett's role at FP Genetics is uncharted territory, with the opportunity to continually evolve as the future unfolds. "I came from research, and now I'm working with retailers — the hub for so many farmers." His role will be working directly with growers and independent agronomists on top of the retail network, educating them on the genetically advanced varieties available, bridging the gap for meeting their customers' needs. Offering solutions, with the traits that matter most.

His territory is carefully mapped out into sub-regions, which will allow him to visit as many retailers as possible, and more importantly, maintain an invaluable face-to-face connection. His goal for year one is simple, yet clear: "Be in front of as many people as I can, create those connections, nurture them. Then, moving forward, be that trusted source and reference point for our partners and the farm's decision makers."

The response has been welcoming and beyond encouraging. "Farmers have made mention they'd like to walk into any retailer and comfortably obtain advice about varieties and agronomics. That's the support and stewardship I will deliver."

His day can typically range from phone calls with growers, to on-site visits and work at trial locations, often joking that the most important thing about his role is

Everett Boots is the new Western Product Specialist for FP Genetics.

when the phone rings, he immediately jumps on it. "With the role being so new and specialized, you never know where that conversation will lead."

Everett takes this role both passionately and personally. In the end it's all about helping farmers confidently reach their full potential — FARMING must WIN. "Weather, interest rates, and commodity prices are all unpredictable, but your seed choice doesn't have to be. I want to help farmers make the most of what they can control and be ready to face the future and its challenges"

He's a natural fit for the role and for the company. Product knowledge can be learned, but qualities like open listening, transparency, and problem solving are deeply rooted in his personality. Everett's approachable nature is already making a positive difference in the field, and his collaborative mindset aligns well with the team's vision.

Everett's work is driven by identifying the challenges farmers face and offering them detailed and accurate solutions. "The door is always open," he says. "Farmers, retailers, agronomists — I'm just a phone call away. Let's develop custom strategies, build best practices, and tailor decisions to your individual needs."

FP Genetics isn't here to just sell seed — it's about the future unfolding, one gene, one variety at a time. It's about coming together to Farm on Purpose, with Purpose! ■

WHEAT BARLEY OATS PEAS FLAX CANOLA

Doug Heaman 204.748.7666 Brittany Vinck 204.851.2049

Oilseeds

Variety Description Key

A “CHECK CHARACTERISTICS” is at the bottom of each table for soybean and sunflower to display the long-term yield, number of site years, maturity and any other check attributes.

The grey box has been placed at the bottom of each table for canola and flax displaying the “GRAND MEAN” for Yield (bu/acre) and the corresponding LSD value ($p < 0.05$).

Except for the long-term average yield, variety description information was obtained from the Co-operative Registration Trials. For Relative Maturity, actual number of days will depend on local climactic conditions and to some extent on management practices.

“Resistance Level” ratings: HS = highly susceptible; S = susceptible; MS = moderately susceptible; MR = moderately resistant; R = resistant; ‘-’ = not available.

Site Years Tested is the cumulative number of locations over the years that a variety has been tested against the check variety.

☞ Indicates a variety that is protected by Plant Breeders’ Rights legislation that complies with UPOV 1978.

☞ Indicates a variety that is protected by, or has been applied for and is pending, Plant Breeders’ Rights legislation that complies with UPOV 1991.

Key to 2025 Yield Tables

CV % = Coefficient of Variation. A measure of random variation in a trial. A low CV is desirable.

LSD = Least Significant Difference. Varieties must differ by the LSD to be considered significantly different from one another.

Sign Diff = Significant Difference. Indicates if a real difference exists between varieties at an individual site.

Canola & Soybean Comments

For specific notes regarding the canola tables, refer to the CANOLA COMMENTS at the top of those respective pages.

For specific notes regarding the soybean tables, refer to the SOYBEAN COMMENTS at the top of page 64.

Canola Variety Evaluation Trials Data:

All variety yields compared as a percentage of the check specific to that trial. Check variety was chosen based on % of acres grown in MASC 2024 Variety Marketshare Report. LibertyLink trial was run as separate from Roundup-Ready. All canola yield trials are straight-cut. Yields derived over two or more growing seasons are the best indicator of variety performance. Use single site year data with caution.

Comments:

Variety descriptions summarize the performance of varieties tested in the 2025 Canola Variety Evaluation Trials. Data donated by the Manitoba Canola Growers Association. For more information visit canolagrowers.com. Lodging is rated on a 1 to 5 scale, where 5 is a completely lodged plant at harvest.

Blackleg Resistance

Varieties in the table below have a resistant (R) rating for Blackleg (<30% infection of Westar check) based on Western Canada Canola/Rapeseed Recommending Committee (WCC/RRC) rating. Lesions and yield loss can still occur, based on the level of inoculum and blackleg pathotype in the field, in combination with environmental conditions conducive for disease development. Some seed distributors have chosen to provide blackleg resistance grouping based on major-gene (qualitative) resistance within that variety in addition to the traditional rating. Labels identifying major resistance genes present will use the letters: A, B, C, D, E1, E2, F, G, H, and X. Adult-plant (quantitative) resistance remains an important factor. Visit blackleg.ca for details on how resistance groups work.

Clubroot Resistance

Clubroot is a long-lived soil-borne disease that can impact canola performance. Using clubroot resistant varieties in rural municipalities where clubroot has been found is highly recommended as a risk mitigation tool. To know for sure if your own fields have clubroot, soil testing is the only way to find out prior to finding galls in the field. See page 64 for the map indicating clubroot distribution in Manitoba.

Clubroot resistance is generally termed 1st or 2nd Generation based on genetic source. First-generation clubroot resistance confers resistance to clubroot pathotypes 2F 3H, 5I, 6M, and 8N, on the Canadian Clubroot Differential Set (Strelkov et al., 2018).

Second-generation sources contain resistance to a varying set of pathotypes outside the original five first-generation pathotypes, but may also have resistance to the original five. For further information on clubroot resistance labels, please visit clubroot.ca, refer to the company website, or speak with your seed representative.

Pod Shatter Resistance

The pod shatter rating scale was developed by the Canola Council of Canada in 2021 and uses a scale of 1-9, with 5-9 meaning lower shatter risk, and 1-4 having higher risk and being more suitable for swathing. Numeric pod shatter ratings are provided by their respective companies, or may not yet be identified on the new rating system.

BrettYoung™ TruFlex® Canola

Stand out in a whole new way

Raxil[®] Rise⁺

**Western Canada's #1 cereal
seed treatment brand* just got better.**

Raxil[®] Rise. Better looking. Harder working. Just as easy as ever. With enhanced control of seed- and soil-borne diseases including true loose smut (thanks to penflufen), it's your new go-to. If you're looking to stand out in a crowded field, stick with the brand seed treaters have trusted for 25 years.

¹ Data from independent canola hybrid testing in the Manitoba Canola Variety Evaluation Trials.

² Data from canola hybrid registration testing at Western Canadian Canola/Rapeseed Recommending Committee Trials.

³ Herbicide tolerance is indicated as LL - LibertyLink, TF - TruFlex, RR - Roundup Ready, CL - Clearfield

⁴ Genetic disease resistance is indicated with an "R" resistant rating to Blackleg, Clubroot, based on variety descriptions submitted to CFIA.

^{4a,b} Additional details of blackleg group and clubroot generation labels provided by respective companies.

⁵ The Canola Council of Canada rating system indicates that 1 = poor, 9 = excellent pod shatter resistance.

Prairie-Harmonized Clubroot Distribution Map

(September 2024, no updates for September 2025)

The map shows symptomatic clubroot findings by rural municipality (RM), discovered through visual field symptoms and presence of clubroot spores in soil through laboratory testing for DNA.

This map is also useful for farmers and/or those who advise growers on either side of the Manitoba-Saskatchewan border. The Ministry of Agriculture in Saskatchewan also shares out this style of map.

FLAX

Comments:

All variety descriptions other than yield are based on data from the Linseed Cooperative Trials in the Prairie provinces.

MCVET flax testing was done in partnership with the University of Saskatchewan Crop Development Centre across all three Prairie provinces in 2025.

All varieties are immune to rust.

All varieties are susceptible to pasmo.

GRAND MEAN (bu/acre)		35									
LSD (p<0.05)		2.3									

¹ Oil quality of flax is based on the amount of linolenic acid measured in the seed or as measured by iodine value which is calculated from the fatty acid composition of the seed. A higher iodine value and/or higher ALA content indicates a higher overall oil quality in the seed.

² E = Excellent; VG = Very Good; G = Good; FG = Fair to Good; F = Fair; PF = Poor to Fair; P = Poor.

SOYBEANS

NOTES FOR ALL SOYBEAN TABLES

Maturity Notes:

Soybean varieties have been organized into 4 maturity zones - very early, early, mid and long season areas.

Relative days to maturity (dam) is the number of days from seeding to plant maturity (95% of the pods on the plant are mature with seeds rattling in the pods when plant is shaken) and is expressed as + or - days from the check. Growers need to be cautious when using only one year data when evaluating maturity and yield. Using multiple year maturity data when available will give you a better indication on how a variety will mature with different growing seasons. Actual days to maturity for the check is found in the grey check box at the bottom of the table.

General Notes:

Herbicide Tolerant and Conventional soybean varieties are evaluated separately, meaning direct comparison of varieties between different tables is not possible. All trials are solid seeded at 210,000 seeds/acre.

Hilum colour can range from Yellow (Y), Imperfect Yellow (IY), Grey (G), Brown (BR), Buff (BF), Tan(TN), Clear (CL), Imperfect Black (IB) or Black (BL) and is solely a marketing issue. The hilum is the point on the soybean seed where it attaches to the pod.

Iron Deficiency Chlorosis (IDC) rating scores 1=green leaves, 2=yellowish leaves, 3=green veins with yellow leaves, 4=brown dead tissue between green veins, 5=severe chlorosis and a stunted growing point. Ratings were taken from sites prone to iron chlorosis over the last 3 years. IDC tolerant varieties are varieties with lower IDC Scores and perform better on soils prone to iron deficiency.

Iron Deficiency Chlorosis (IDC) grouping is used because varieties will have different visual rating scores from year to year. Numerical ratings which are close but are in different groupings will show similar symptoms. Both numerical and groupings should be considered together when judging IDC. Tolerant=leaves stayed green, Semi Tolerant=leaves when yellow then turned green, Susceptible= leaves went chlorotic and had dead patches on their leaves and were often stunted.

WESTERN MANITOBA HERBICIDE TOLERANT SOYBEANS

Comments:

The Western Manitoba soybean variety trial was sponsored by the Manitoba Pulse & Soybean Growers.

SUNFLOWERS - CONFECTIONARY TYPE

Comments:

These varieties were tested and data donated by the Manitoba Crop Alliance (MCA).

All sunflowers varieties listed are susceptible to sclerotinia and sunflower rust strains present in Manitoba.

Genetic resistance to verticillium wilt is rated as moderately susceptible to moderately resistant for all sunflower varieties presented.

Plant population and environment will contribute greatly to the final product.

Variety Descriptions

SUNFLOWERS - OIL TYPE

Comments:

These varieties were tested and data donated by the Manitoba Crop Alliance (MCA).

Oil sunflower markets include bird food, oil crush and de-hull. Variety selection becomes more important when trying to capture de-hull markets. Choose varieties with better de-hull ratio, larger size and higher test weight. Environment will contribute greatly to final product.

Plant population and environment will contribute greatly to the final product.

Per cent (%) oil content was unavailable at press time, visit mbcropalliance.ca for more detail.

Variety Descriptions

Company	Variety	Herbicide/Disease Tolerance ¹	Site Years	Yield (% check)	Maturity ² (+/- check)	Height (+/- check, inches)	Oil Type ³	Test Weight ⁴

CHECK CHARACTERISTICS

P63ME80	33 site years	2667 lb/ac	125 days	62 inches
----------------	---------------	------------	----------	-----------

¹ Genetic traits include CL = Clearfield herbicide tolerance; ExSun = Express SG herbicide tolerance; DM = Downy Mildew Resistance.

² Physiological maturity for sunflowers is R9, where the bracts on the head are almost completely brown.

³ Oil Type include NS=NuSun; HO=High Oleic; CO = ConOil

⁴ Test weights reported in lbs per Avery (Canadian) bushel.

¹ Physiological maturity for sunflowers is R9, where the bracts on the head are almost completely brown. ² Test weights are reported in lbs per Avery (Canadian) bushel.

³ Totals may not add to 100% due to rounding.

Refer to the MCA website at mbcropalliance.ca for more details.

Proven Performance Trusted Genetics

Nufarm Sunflowers are for growers who want North American-bred and tested hybrids that deliver reliable yield, high oil, herbicide tolerance, and strong disease resistance – year after year.

nufarm
Evolving Ag

Contact your local Nufarm distributor to learn about our newest high-oleic hybrids and to reserve your seed today!

Nufarm® is a registered trademark of Nufarm Limited and an exclusive distributor of the brands and traits referenced through its seeds platform (formerly represented as Nuseed). NuSun® is a registered trademark of the National Sunflower Association.

DISTRIBUTOR CONTACTS FOR LISTED VARIETIES IN SEED MANITOBA 2026

Look up variety within the correct CROP KIND to find the company, then look for company phone number in the box at end of this section.

Variety Description Key

A “CHECK CHARACTERISTICS” box has been placed at the bottom of each table to display the long-term yield, site years, maturity and any other check attributes.

Except for the long-term average yield, variety description information is obtained from the Co-operative Registration Trials. For relative maturity, please keep in mind the actual number of days to reach maturity will depend on local climatic conditions and to some extent on management practices.

“Resistance Level” ratings: VG = Very Good; G = Good; F = Fair; P = Poor; VP = Very Poor; “n/a” = not available

Site Years Tested is the cumulative number of locations over the years that a variety has been tested against the check variety. The more site years, the more dependable the data.

☞ Indicates a variety that is protected by Plant Breeders’ Rights legislation that complies with UPOV 1978

Ⓢ Indicates a variety that is protected by or has been applied for and is pending, Plant Breeders’ Rights legislation that complies with UPOV 1991

VUA Variety Use Agreement in effect

TKW (Thousand Kernel Weight) is the weight in grams of 1000 seeds.

Key to 2025 Yield Tables

Yields derived over two or more growing seasons are the best indicator of variety performance. For new varieties, the average yield over all sites is more reliable than data from a single location. Use single site year data with caution.

CV % = Coefficient of Variation. A measure of random variation in a trial. A low CV is desirable.

LSD = Least Significant Difference. Varieties must differ by the LSD to be considered significantly different from one another.

Sign Diff = Significant Difference. Indicates if a real difference exists between varieties at an individual site.

FABABEANS

Comments:

The fababeans variety trial was tested by MCVET and partially sponsored by the Manitoba Pulse & Soybean Growers.

Traditionally tannin fababeans with tan coloured seed coats and coloured flowers contain tannins and can't be fed directly to livestock.

Low tannin fababeans have white seed coats and flowers and can be fed directly to livestock.

* Maturity ratings are based on days until swathing, but will vary depending on seeding date.

FIELD BEANS - MANITOBA NARROW ROW TRIALS

Comments:

Long-term yield data and days to maturity are Manitoba Pulse & Soybeans Growers (MPSG) Trials grown in 10 to 12 inch row spacing.

More detailed measurements from the trials are available to MPSG members and will be distributed in the December Special Edition of the Pulse Beat magazine.

Days to maturity is critical. Do not select a variety that will not mature in time, under normal growing conditions. Early fall frost severely affects yield and quality.

¹ Maturity data provided to compare relative differences among varieties - actual maturity will vary depending on seasonal growing conditions.

FIELD BEANS - WIDE ROW TRIALS

Comments:

Long-term yield data and days to maturity are from Manitoba Pulse & Soybean Growers (MPSG) trials.

Individual site and more detailed measurements from these trials are available to MPSG members and distributed free in the Winter Edition of the Manitoba Pulse Beat to all MPSG members in good standing.

Results are from row crop trials located at Morden, Portage, Carman, and Winkler sites.

¹ Annual weather variations will impact the actual number of days it takes a variety to fully mature, so will vary from year to year. Choosing a variety that needs a longer growing season than your farm has increases your risk of frost damage and lower returns.

² Fusarium Root Rot- MR -Moderate Resistance, I=Indeterminate

³ Green seed coats: G = 0-10%; F = 11-25%

⁴ Seed coat dimpling rating : VG = 0-5%; G = 6-20%; F = 21-50%

For Protein data on Peas please go to seedmb.ca

A number of new varieties are participating in a Variety Use Agreement **VUA**. If producers purchase a VUA variety and divert some of that grain at harvest for seed use, they will be invoiced a Variety Use Fee for use of the seed. Ask your retailer about your obligations to the VUA when purchasing seed.

The Prairie Recommending Committee for Pulse and Special Crops (PRCPSC) is responsible for the testing and evaluation of pulse and special crop candidate cultivars for registration in Western Canada.

Special Crops

Key to 2025 Yield Tables

Yields derived over two or more growing seasons are the best indicator of variety performance. Use single site year data with caution.

CV% = Coefficient of Variation. A measure of random variation in a trial. A low CV is desirable.

LSD = Least Significant Difference. Varieties must differ by the LSD value to be considered significantly different from one another.

Sign Diff = Significant Difference. Indicates if a real difference exists between varieties at an individual site.

GRAIN CORN - LONG SEASON

Comments:

Carman bushel weight is missing due to a software issue at harvest time.

The grain corn hybrid trial was tested and the data donated by the Manitoba Corn Committee (MCC). The data presented is for one year only. Use with caution.

All hybrids were evaluated at a plant population of 32,000 plants per acre.

Yields are corrected to 15.5% moisture content.

The Manitoba Corn Committee publishes the annual results along with more detailed lab analysis in their brochure. The brochure is available by calling the Manitoba Crop Alliance office at 204-745-6661 or visiting their website at mbcropalliance.ca

¹ Each company assigns a corn heat unit (CHU) rating to each of their hybrids. The CHU rating is a measure of relative maturity and is one criteria for choosing a hybrid suitable to your growing region.

² See table below for explanation of codes for special genetic traits. Although the Manitoba Corn Committee believes that information contained in this report is accurate, growers are advised to consult dealers of the respective hybrids before making purchasing or management decisions. Seeds Canada provides a database for corn hybrids available in Canada at seeds-canada.ca/corn-hybrid-database. Information provided includes technology, brand name and refuge requirements.

¹ Each company assigns a corn heat unit (CHU) rating to each of their hybrids. The CHU rating is a measure of relative maturity and is one criteria for choosing a hybrid suitable to your growing region.

² See table below for explanation of codes for special genetic traits. Although the Manitoba Corn Committee believes that information contained in this report is accurate, growers are advised to consult dealers of the respective hybrids before making purchasing or management decisions. Seeds Canada provides a database for corn hybrids available in Canada at seeds-canada.ca/corn-hybrid-database. Information provided includes technology, brand name and refuge requirements.

ELITE GENES YIELD THE BEST BEANS

The exceptional reputation of our soybeans is built on the performance of our proprietary germplasm, year after year.

That genetic strength drives our newest soybeans, pushing the yield potential and agronomic bar higher, in every season and every soil.

Find the fit for your acres.

syngenta®

From the Swan River Valley to the Red River Valley, and everywhere in between, we have the right fit for your acres.

ROUNDUP READY 2
XTEND
SOYBEANS

S0009-J5X

- 2275 CHU / 0.009
- Very good standability
- Very good white mould resistance

ROUNDUP READY 2
XTEND
SOYBEANS

S001-D8X

- 2300 CHU / 0.01
- Very good drought tolerance
- Tall, excellent pod height

ROUNDUP READY 2
XTEND
SOYBEANS

S003-R5X

- 2325 CHU / 0.03
- Numerous 5-bean pods
- Very good phytophthora tolerance

XTENDFLEX
SOYBEANS

NEW

S005-Z5XF

- 2350 CHU / 0.05
- Dicamba, Glufosinate and Glyphosate tolerant
- Excellent emergence

ROUNDUP READY 2
XTEND / STS®

S007-A2XS

- 2425 CHU / 0.07
- Very good yield potential
- Sulfonyleurea tolerant, great option for residue concerns

Always read and follow insect resistance management requirements (where applicable), grain marketing and all other stewardship practices and pesticide label directions. Forages

Key to 2025 Yield and Quality Tables

Yields derived over 2 or more growing seasons are the best indicator of variety performance. Use single site year data with caution.

CV % = Coefficient of Variation. A measure of random variation in a trial. A low CV is desirable.

LSD = Least Significant Difference. Varieties must differ by the LSD to be considered significantly different from one another.

Sig Diff = Significant Difference. Indicates if a real difference exists between varieties at an individual site.

☞ Indicates a variety that is protected by Plant Breeders' Rights legislation that complies with UPOV 1978.

© Indicates a variety that is protected by, or has been applied for and is pending, Plant Breeders' Rights legislation that complies with UPOV 1991.

VUA Variety Use Agreement in effect.

Forage Variety Registration Changes

Amendments to the Seeds Act Seeds Regulations are now in effect that streamline the variety registration process for forage varieties.

Forage crops are moved to Part III of Schedule III of the Seeds Regulations. Recommending Committees are no longer required for the registration of forage crop varieties, since the testing and merit requirements are removed. Registration still requires a standard application package to enable the CFIA to continue to protect health and safety, prevent fraud, and facilitate seed certification.

FORAGE ADAPTATION & COMPARISON GUIDE

LEGUMES

Forage	Use	Longevity	Winter Hardi-ness	Tolerance to:			Preferred Climate and Growing Conditions
				Drought	Flooding	Salinity	
Alfalfa	Hay & Pasture	Long	Good	Good	Low	Low to Moderate	Widely adapted to most Manitoba soils but will not tolerate areas that have periodic flooding.
Alsike Clover	Hay & Pasture	Short	Fair	Poor	Moderate	Low	Low-lying moist areas.
Birdsfoot Trefoil	Pasture	Long	Good	Moderate	High	Low to Moderate	Moist areas.
Cicer Milkvetch	Pasture	Long	Good	Moderate to High	Low	Moderate	Widely adapted but exhibits its habit best on more coarse textured soils.
Kura Clover	Pasture	Long	Good	Moderate	Moderate	Unknown	Tolerates low fertility and soil acidity, wet soils and some flooding.
Red Clover	Hay & Pasture	Short	Poor	Low	High	Low	Best suited to humid areas with moderate temperatures.
Sainfoin	Pasture	Long	Fair	High	Low	Low	Best on brown and dark brown soil areas. In very dry areas it yields poorly. Does well on thin gravelly soils.
Sweet Clover	Hay & Pasture	Short to Long	Good	Poor	Low to Moderate	Low	Prefers well drained silt loams to clay soils that have a consistent supply of moisture.
White Clover	Hay & Pasture	2-years	Fair	Moderate to High	Low	Moderate	Especially productive on fertile soils.

TAME GRASSES

Altai Wild Ryegrass	Pasture	Long	Excellent	High	Low	Very High	Loam and clay soils best, but grows on a wide range of soils. Doesn't appear adapted to Manitoba conditions.
Annual (Italian) Ryegrass	Hay & Pasture	Short Annual 1 year	Poor	Low	High	Low	Produces best on soils of medium to high fertility and grows best with adequate moisture.
Creeping Foxtail	Pasture	Long	Good	Low	High	Moderate	Adapted to areas where reed canarygrass grows well and soil moisture is continually available.
Creeping Red Fescue	Pasture Lawn	Long	Excellent	Moderate	Moderate	Low	Does best in high rainfall areas. Will grow in wide range of soil types.
Crested Wheatgrass	Hay & Pasture	Long	Excellent	Moderate to High	Low	Low to Moderate	Adapted to dry areas with good soils but will also establish on lighter soils.
Dahurian Wild Ryegrass	Pasture	Short	Good	Moderate	Low	High	Adapted to all soil zones.
Intermediate Wheatgrass	Hay & Pasture	Short to Medium	Good	Moderate to High	Low	Low	Well drained soils with ample moisture.
Kentucky Blue Grass	Pasture Lawn	Long	Excellent	Moderate	Moderate	Low	Prefers cool and humid. Grows on most soils.
Meadow Brome grass	Hay & Pasture	Long	Good	High	Low	Low	Grows well on most soils where Smooth Brome does well.
Meadow Fescue	Pasture	Short - Medium	Good	Moderate	High	Low to Moderate	Prefers soil with good moisture and good drainage.
Meadow Foxtail	Pasture	Long	Good	Low	High	Low	Prefers cool moist conditions. High water table.
Orchard grass	Hay & Pasture	Short	Fair	Moderate	Low to Moderate	Low	Prefers moist conditions. Sandy soils are too dry for good growth unless in high rainfall area.
Perennial Ryegrass	Hay & Pasture	Short	Poor	Low	Low	Low	Needs high precipitation and fertility for high yields. Adapted to a wide range of soils.
Pubescent Wheatgrass	Hay & Pasture	Medium	Good	Moderate to High	Low	Low to Moderate	Widely adaptable with respect to precipitation, temperature, elevation, and low fertility soil.
Russian Wild Ryegrass	Pasture	Long	Excellent	Very High	Low	Very High	Can be grown on a wide range of soils. Most productive on fertile loams.
Smooth Brome grass	Hay & Pasture	Long	Excellent	Moderate	Moderate	Low to Moderate	Well adapted to all soils in Manitoba.
Tall Fescue	Pasture	Medium	Good	Moderate	Moderate to High	High	Variety of soils. Does well on wet, poorly drained soils.
Tall Wheatgrass	Hay & Pasture	Medium	Excellent	Low	High	High	Adapted to saline and imperfectly drained alkali soils.
Timothy	Hay & Pasture	Medium	Good	Low	High	Low	Cool moist areas with good drainage.

Native Grasses	Use	Longevity	Winter Hardi-ness	Tolerance to:			Preferred Climate and Growing Conditions
				Drought	Flooding	Salinity	
Awned Wheatgrass	Hay & Pasture	Medium	Good	Moderate	Moderate	Low to Moderate	Prefers moderately sandy to loam soils with good moisture and drainage. Found in moist flats, meadows and low growing bushes
Big Bluestem	Pasture	Long	Good	Low to Moderate	Moderate	Low to Moderate	Grows under a wide range of conditions.
Green Needlegrass	Pasture	Long	Good	High	Moderate	Low to Moderate	Performs best on medium to heavy textured soils. Prefers moist sites with good drainage.
Little Bluestem	Pasture	Long	Good	High	Low	Moderate	Sandy, gravelly soils with shallow water table or where snow accumulates. Common on Prairie upland.
Northern Wheatgrass	Pasture	Long	Good	Very High	Moderate	Moderate	Prefers medium to coarse textured soil.
Prairie Cord Grass	Hay & Riperian	Long	Good	Low to Moderate	High	Low to Moderate	Wide range of soils (sand to clay) - does best on seasonally dry areas, marsh edges, wet meadows, drainageways.
Reed Canarygrass	Hay & Pasture	Long	Good	Moderate	Very High	Low	Moist cool climate. Poorly drained areas subject to temporary flooding.
Side Oats Grama	Hay & Pasture	Long	Good	Moderate to High	Low	Low to Moderate	Adapted to a range of soils. Performs best on fine textured soils. Found on rocky ridges, open grasslands and hillsides.
Slender Wheatgrass	Hay & Pasture	Medium	Good	Moderate	Moderate	High	Widely adapted - prefers sandy loams.
Switch grass	Pasture	Medium	Fair	Low	Moderate	Moderate	It has potential for good summer pasture when enough moisture. Grows best on loam and sandy loams.
Western Wheatgrass	Hay & Pasture	Long	Excellent	High	Moderate to High	High	Widely adapted - prefers heavy moderately aklaline soil. Tolerates periodic flooding.

SILAGE CORN

Comments:

The silage corn hybrid trials were tested and the data released by the Manitoba Corn Committee (MCC).

The data presented here is for one year only. Use with caution.

All hybrids were evaluated at a target plant population of 32,000 plants per acre.

Yields are corrected to 65% moisture.

The Manitoba Corn Committee publishes the annual results along with more detailed lab analysis in their brochure. The brochure is available by calling the Manitoba Crop Alliance office at 204-745-6661 or visiting their website at mbcropalliance.ca

¹Each company assigns a corn heat unit (CHU) rating to each of their hybrids. The CHU rating is a measure of relative maturity and is one criteria for choosing a hybrid suitable to your growing region.

²See table below for explanation of codes for special genetic traits. Although the Manitoba Corn Committee believes that information contained in this report is accurate, growers are advised to consult dealers of the respective hybrids before making purchasing or management decisions. Seeds Canada provides a database for corn hybrids available in Canada at seeds-canada.ca/corn-hybrid-database. Information provided includes technology, brand name and refuge requirements.

³Moisture content at harvest.

⁴Milk per Acre was calculated using MILK2006, a model developed by the University of Wisconsin Extension Service.

⁵Beef per Acre was calculated on the assumption that one pound of beef is produced for every six pounds of TDN.

Explanation of Codes for Special Genetic Traits

19	Agrisure GT/CB/LL or Agrisure 3010	34	Duracade Viptera

ANNUAL FORAGES

The MCVET Annual Forage trials evaluated different crop types and varieties for forage yield and quality for livestock feed.

Annual crops are more moisture efficient than perennial forages such as alfalfa or timothy.

Both warm (sorghum, millet) and cool season crops were included in the trials. Warm season crops are more drought and heat tolerant than cool season crops.

Varieties were selected for their higher grain yield, taller growth, lodging resistance, and better disease resistance.

Quality is highly dependent on plant maturity at harvest. For optimum quality: harvest barley at early-mid dough stage; oats & triticale at milk-early dough stage; peas at full pod formation; millet and sorghum at early heading.

Variety Descriptions

Variety descriptions for wheat, barley and oat crop types can be found in the Cereal Crops section of Seed Manitoba 2026 pages 15-39

Field pea variety information can be found on pages 90-91.

2025 ANNUAL FORAGE - YIELD COMPARISONS

The 2025 annual forage trial combined all crops and varieties in one trial with three replicates per site.

Quality is highly dependent on plant maturity at harvest. Barley was harvested in mid dough stage; oats & triticale at milk- early dough stage; peas at early pod wrinkle; millet and sorghum at heading.

Millet Average						3.65
Sorghum Sudangrass	common ²	2.6	3.9	12.6	6.9	6.50
Forage Sorghum	common ²		2.5	10.1	9.9	7.50
Sorghum Average						7.00
Cover crop	Cover crop blend	1.6	3.2	4.5	5.8	3.78
Grand Mean (tonnes/acre)		2.4	3.6	5.8	6.1	
CV %		18.9	3.5	9.5	18.6	
LSD (0.05)		0.8	0.2	1.2	1.9	
Sig Diff		Yes	Yes	Yes	Yes	
Seeding Date		May 6 & 27	May 8	June 4	May 26	
Harvest Date		24-Jul	Aug 7,11 & 12	Aug 12,13 & 20	Aug 12 & Sept 23	

¹ Dry matter yields measured under a one-cut system.

² Due to lack of availability, common seed was used.

Sorghum and millet were harvested later at most of the sites due to their later maturity.

Sorghum and millet were seeded later in Arborg.

CropConnect
Conference 2026

REGISTER TODAY!

February 11 & 12

Victoria Inn Hotel and Convention Centre in Winnipeg, MB.

www.cropconnectconference.ca

Banquet Speakers

Patti Durand and Chris Corbett

Leadership & Management Mentors, Brightrack Consulting

Keynote Speakers

Jacob Shapiro

Director of Research, Bespoke Group

Peter Mansbridge

Award-winning Journalist, Former Chief Correspondent for CBC News & Anchor of The National

DISTRIBUTOR CONTACTS FOR FORAGE VARIETIES IN SEED MANITOBA 2026

Look up variety within the correct CROP KIND to find the company, then look for company phone number in the box at bottom of section.

FORAGE

See cereal and pulse distributor contacts and growers list for forage varieties of oat, barley, and pea. See forage growers list for perennial forage types.

Is the grass greener on the other side of the fence?

Benchmark your farming practices with the Manitoba Management Plus Program

- Access unbiased and aggregated on-farm variety and yield information from Manitoba producers.
- Compare your varieties and yield performance with your neighbours to make smarter decisions and reduce your risk of losses.
- Determine the best crops to plant and find other useful agronomic information.

Kip says,
**“GUESSING IS FINE
FOR DOG BREEDS AT
THE PARK – NOT FOR
SEED IN YOUR BINS.”**

Pedigreed seed is more than a bag tag. It is proven genetics that provide clean fields and confidence at harvest. Talk to your local seed grower or retailer today, and put the best new genetics to work on your farm.

ADVANCING THE UNSTOPPABLE SUPERPOWER OF PRE-SEED.TM

WEEDS EVOLVE, SO DO WE.

Start clean with the advancing power of Nufarm's pre-seed burndown portfolio in canola, cereals and pulses. Our evolving portfolio keeps the farmer in mind to deliver performance, convenience and resistance management in a single package – it's pre-seed power without the complexity.
